

Terraseeding

Terraseeding is a patented process of seeding applied by blowing in a one or two inch compost blanket, which is injected with seed at the time of application. Terraseeding is blown in place with the use of a pneumatic blower truck equipped with a supplemental seed injection system. This system will allow for the calibrated injection of required seed into the compost at the time of application. The seed use will be provided according to spec. Seed will be injected at a rate of 5 lbs. per cubic yard of compost, or between 12-15 lbs. of seed for every 1,000 square feet.
